An assistant professor of history, Mark Carey specializes in environmental history and the history of science. His integrative approach to climate-change research incorporates environmental history, Latin American history, social history, and glaciology. His book, *In the Shadow of Melting Glaciers: Climate Change and Andean Society*, examines the human costs of climate change in Peru and weighs the implications of glacier retreat.

“I’m not a traditional historian,” Carey says. “Most historians spend all their time in the archive reading, but I like to get out and go to the mountains. Analyzing scientists and engineers in the field and talking with the people who actually live near glaciers provides depth and understanding to issues that are happening now.”

**MAJOR AWARDS**

- National Science Foundation Faculty Early Career Development
- Elinor Melville Prize, Conference on Latin American History
- Faculty Excellence Award, Center for Multicultural Academic Excellence
